

Subject: PRF192 - Programming Fundamental with C

Workshop 3

Objectives:

In this workshop, you will:

- To understand how to manipulate and process arrays in C.
- To practice using functions for modular programming: data input, search, display, and calculations.
- To implement a search function that allows users to find a specific number within the array.
- To perform basic calculations on the array such as sum, average, maximum, and minimum values.
- To display results clearly and efficiently.

Problem Overview:

In this problem, the user is required to manage an array of numbers and perform various tasks on it. The program should allow the user to:

1. **Input Data:** The user will input a set of numbers and store them in an array.
2. **Display Data:** Display the contents of the array.
3. **Search Function:** Search for a specific number within the array and return the index where it is located.
4. **Calculations:**
 - Calculate the sum of all elements in the array.
 - Calculate the average of the array elements.
 - Find the maximum and minimum values in the array.
5. **Output:** The program should output the results of the display, search, and calculations.

Situation Description:

This problem can be related to real-world scenarios, such as:

- **Sales Data:** A store might need to input sales data for different products over the month, display the data, search for specific sales values, and calculate the total and average sales.
- **Grades Data:** A teacher might want to calculate the average score of students in a class, find the highest and lowest grades, and search for specific student scores.

- **Weather Data:** A meteorologist could use the program to input temperature readings for a week, search for specific days, and calculate the average and extremes.

The ability to manipulate and process arrays effectively is critical in many data-driven applications.

Syntax Use in the Problem:

1. **Array Declaration:** Arrays are used to store the list of numbers that the user inputs.
2. **Functions:** The program is divided into functions that perform specific tasks, such as input, display, search, and calculation.
3. **Loops:**
 - **for** loops will be used to iterate over the array for tasks such as input, searching, displaying, and calculating.
4. **Conditional Statements:**
 - **if** and **else** statements will be used to check whether the search value is found and for handling conditions like checking if the array is empty.
5. **Basic Arithmetic Operations:** Simple arithmetic is used to calculate the sum, average, and extremes of the array values.

Specific Requirements:

1. **Input:**
 - The user must input the number of elements in the array (within the range of 1 to 100).
 - The user will then input the actual values of the array elements.
2. **Display:**
 - After the user inputs the data, the program will display all the values in the array.
3. **Search:**
 - The program will allow the user to input a value to search for in the array.
 - The program will display the index of the value if found; if not found, it will display a message saying the value is not present.
4. **Calculations:**
 - The program should calculate:

- **Sum:** The sum of all elements.
- **Average:** The average of the elements.
- **Maximum and Minimum:** The maximum and minimum values from the array.

5. Modular Programming:

- Each task (input, display, search, and calculations) will be handled by separate functions, making the program clear, maintainable, and reusable.

6. Edge Case Handling:

- The program should handle an empty array or an array with only one element.
- It should also validate the input for correct number of elements.

Hint: Code Design

```

1  #include <stdio.h>
2
3  #define MAX_SIZE 100
4
5  // Function prototypes
6  void inputArray(int arr[], int *size);
7  void displayArray(int arr[], int size);
8  int searchValue(int arr[], int size, int target);
9  void calculateStatistics(int arr[], int size);
10
11 int main() {
12     int arr[MAX_SIZE], size = 0, target, index, choice;
13
14     // Menu loop
15     do {
16         // Display the menu
17         printf("\n--- Menu ---\n");
18         printf("1. Input data\n");
19         printf("2. Display array\n");
20         printf("3. Search for a number\n");
21         printf("4. Calculate statistics (Sum, Average, Max, Min)\n");
22         printf("5. Exit\n");
23         printf("Enter your choice: ");
24         scanf("%d", &choice);
25
26         switch(choice) {
27             case 1:
28                 // Input data
29                 inputArray(arr, &size);
30                 break;
31             case 2:
32                 // Display array
33                 if (size > 0) {
34                     displayArray(arr, size);
35                 } else {
36                     printf("No data to display. Please input data first.\n");
37                 }
38                 break;

// Function to input array data
void inputArray(int arr[], int *size) {
    // ...
}

// Function to display array elements
void displayArray(int arr[], int size) {
    // ...
}

// Function to search for a value in the array
int searchValue(int arr[], int size, int target) {
    // ...
}

// Function to calculate and display statistics (sum, average, max, min)
void calculateStatistics(int arr[], int size) {
    // ...
}

```

Output Sample:

1. Input Data

```
D:\MonHoc\PRF192\ThucHanh\Workshop03.exe

--- Menu ---
1. Input data
2. Display array
3. Search for a number
4. Calculate statistics (Sum, Average, Max, Min)
5. Exit
Enter your choice: 1
Enter the number of elements (1-100): 101
Invalid size! Please enter a number between 1 and 100.
Enter the number of elements (1-100): -2
Invalid size! Please enter a number between 1 and 100.
Enter the number of elements (1-100): 5
Enter 5 numbers:
Number 1: 15
Number 2: 10
Number 3: 20
Number 4: 8
Number 5: 30
```

2. Display array

```
D:\MonHoc\PRF192\ThucHanh\Workshop03.exe

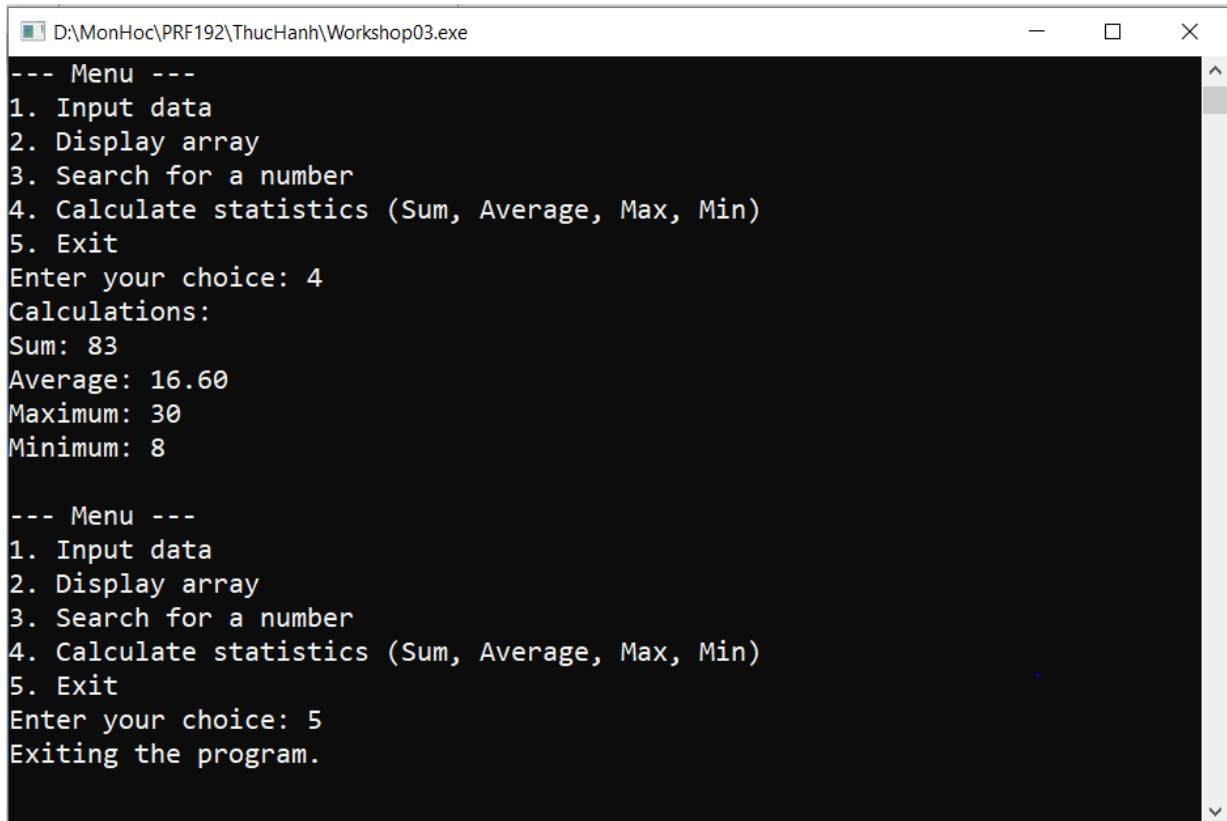

--- Menu ---
1. Input data
2. Display array
3. Search for a number
4. Calculate statistics (Sum, Average, Max, Min)
5. Exit
Enter your choice: 2
Array elements:
15 10 20 8 30
```

3. Search for a number

```
D:\MonHoc\PRF192\ThucHanh\Workshop03.exe

--- Menu ---
1. Input data
2. Display array
3. Search for a number
4. Calculate statistics (Sum, Average, Max, Min)
5. Exit
Enter your choice: 3
Enter the number you want to search for: 8
The number 8 is found at index 3.
```

4. Calculate statistics (Sum, Average, Max, Min) and Exit Program

```
D:\MonHoc\PRF192\ThucHanh\Workshop03.exe

--- Menu ---
1. Input data
2. Display array
3. Search for a number
4. Calculate statistics (Sum, Average, Max, Min)
5. Exit
Enter your choice: 4
Calculations:
Sum: 83
Average: 16.60
Maximum: 30
Minimum: 8

--- Menu ---
1. Input data
2. Display array
3. Search for a number
4. Calculate statistics (Sum, Average, Max, Min)
5. Exit
Enter your choice: 5
Exiting the program.
```
